

Verifies what was built. **Runs real tests on real code**, drives the portals through MFA, and reports verdicts where humans look.

TFactory verify pipeline — Plan, Generate, Execute, Report

## WHAT SHIPPED

### A verification pipeline

Plan, Generate, Execute, Report — a live view of every verification stage from test planning to a triaged verdict.

### A continuous regression suite

A nightly and on-demand regression system with retry, quarantine, drift and impact analysis, surfaced in the portal.

### The unified shell

The portal switcher, global Cmd-K search, and fleet 'needs you' badge now live here too.

### Real tests on real code

Verification checks out the actual build branch and runs the tests against the code that was written, not a text summary.

### Portal-UI testing

A Playwright harness logs into every portal through real Keycloak MFA and captures screenshots and verdicts — the same harness used for this showcase.

### Latest models

Verification runs on the current model lineup, defaulting to Claude Opus 4.8.

## THE PATH FORWARD

The path forward: broader language and browser coverage, deeper deployment verification, and verdicts an operator can trust without re-checking by hand.
